V

(54) Title: METHODS FOR GENE TRANSFER USING PSEUDOTYPED LENTIVIRUSES

(57) Abstract: Methods for introducing nucleic acid sequences into hepatocytes, brain glial cells and airway epithelial cell are provided. The methods use filoviral and togaviral glycoprotein-pseudotyped lentiviruses. The viruses comprise a lentiviral capsid and a viral envelope further comprising a lipid bilayer and a functional filoviral glycoprotein or two functional togaviral glycoproteins. In one embodiment the lentivirus is a feline immunodeficiency virus (FTV). In an alternate embodiment, the filoviral glycoprotein is a Marburg virus glycoprotein. In another embodiment, the Marburg virus glycoprotein can have a mutation in the C-terminal portion of the amino acid sequence that results in a higher titer production of the pseudotyped virus. In an alternate embodiment the togaviral glycoproteins are alphavirus glycoproteins, for example, the E1 and the E2 envelope glycoproteins of Ross River virus (RRV).

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US02/34545

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)					
This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:					
Claim Nos.: because they relate to subject matter not required to be searched by this Authority, namely:					
2. Claim Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:					
3. Claim Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).					
Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)					
This International Searching Authority found multiple inventions in this international application, as follows: Please See Continuation Sheet					
1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.					
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.					
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:					
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:					
Remark on Protest The additional search fees were accompanied by the applicant's protest. No protest accompanied the payment of additional search fees.					

PCT/US02/34545 INTERNATIONAL SEARCH REPORT BOX II. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid. Group I, claim(s) 1-9 and 15-19, drawn to a pseudotyped lentivirus comprising a lentiviral capsid, a lipid bilayer, and a Marburg glycoprotein having the cited mutations, and a method of introducing a nucleic acid encoding a desired protein into an airway epithelial cell by transducing the epithelial cell with a pseudotyped lentivirus comprising a lentiviral capsid, a lipid bilayer surrounding said capsid, a filoviral glycoprotein dispersed in said bilayer, and a nucleic acid encoding a desired protein. Group II, claim(s) 10-14 and 20-26, drawn to a method of introducing a nucleic acid encoding a desired protein into a hepatocyte or a brain glial cell, or a liver or brain in a mammal by transducing the said cell with a pseudotyped lentivirus comprising a lentiviral capsid, a lipid bilayer surrounding said capsid, at least two different togaviral glycoproteins dispersed in said bilayer, and a nucleic acid encoding a desired protein. The inventions listed as Groups I and II do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: They are drawn to different scientific considerations by using different pseudotyped lentivirus: a pseudotyped lentivirus comprising a filoviral glycoprotein or Marburg glycoprotein having cited mutations dispersed in the lipid bilayer vs a pseudotyped lentivirus comprising at least two different togaviral glycoproteins dispersed in the lipid bilayer, and transducing said lentivirs into different types of cells or target sites: airway epithelial cells vs hepatocyte and brain glial cells or liver and brain. Therefore, they are drawn to different methods that differ at least in process steps, reagents and dosages used, schedules used, response variables, and criteria of success. Thus, groups I and II do not relate to a single general inventive concept under PCT Rule 13.1.
